Thankyou, for reading this small leaflet about our project and how it works. If you have any more questions about the project or the software, please ask any of us.

What is Am I A QT?

Am I A QT is a Artificial Intelligence program which is used to evaluate the attractiveness of the user. This is mainly by providing an image of your face either by webcam or photo upload. This should hopefully then return a score depicting the attractiveness of the user using the application.

How the application works?

In order for the application to work the website interface for the program must be loaded. The interface then asks a number of questions such as whether you are a male or female, and also asks how you would like to upload an image.

The user then provides the image, and this is sent though to an Artificial intelligence program which rates the attractiveness of the user.

After the evaluation of the image, it will send an image back to the user, demonstrating their attractiveness.

How does the application evaluate attractiveness?

In order to start to evaluate a face, the program first detects the face and the facial features. Using the face and features, the program then tries to find the most similar face to the uploaded image, this is done using a database which contains numerous different faces and scores for each face.

Once the face most similar to the image has been found, the program then finds the score of the similar image and returns it back to the interface of the system. Presenting it to the user in a score box.
